

Ex: Compute the Flux of $\vec{F} = \langle y, x, z \rangle$ across the boundary of the solid enclosed by paraboloid $z = 1 - x^2 - y^2$ and plane $z = 0$

Sol: $\iint_S \vec{F} \cdot d\vec{S} = \iint_D \vec{F} \cdot (\vec{r}_u \times \vec{r}_v) dA$

↑
Domain of parameterization $\vec{r}(u, v)$ for surface S .

parameterize S_1 : $\vec{r}(u, v) = \langle u \cos(v), u \sin(v), 0 \rangle$ on $D_1 = [0, 1] \times [0, 2\pi]$

parameterize S_2 : $\vec{s}(u, v) = \langle u \cos(v), u \sin(v), 1 - u^2 \rangle$ on $D_2 = [0, 1] \times [0, 2\pi]$

$$\iint_S \vec{F} \cdot d\vec{S} = \iint_{D_1} \vec{F} \cdot (\vec{r}_u \times \vec{r}_v) dA + \iint_{D_2} \vec{F} \cdot (\vec{s}_u \times \vec{s}_v) dA$$

consider the orientation:

$$\vec{r}_u = \langle \cos(v), \sin(v), 0 \rangle \quad \vec{r}_v = \langle -u \sin(v), u \cos(v), 0 \rangle$$

$$\therefore \vec{r}_u \times \vec{r}_v = \det \begin{bmatrix} \vec{i} & \vec{j} & \vec{k} \\ \cos(v) & \sin(v) & 0 \\ -u \sin(v) & u \cos(v) & 0 \end{bmatrix}$$

$$= \langle 0, 0, u \rangle \rightarrow \text{orientation is inward here, so negate.}$$

$$\vec{s}_u = \langle \cos(v), \sin(v), -2u \rangle$$

$$\vec{s}_v = \langle -u \sin(v), u \cos(v), 0 \rangle$$

$$\therefore \vec{s}_u \times \vec{s}_v = \det \begin{bmatrix} \vec{i} & \vec{j} & \vec{k} \\ \cos(v) & \sin(v) & -2u \\ -u \sin(v) & u \cos(v) & 0 \end{bmatrix}$$

$$= u \langle 2u \cos(\theta), 2u \sin(\theta), 1 \rangle$$

looking at $u = \frac{1}{2}$ again, this is oriented outward.

$$\therefore \vec{F} \text{ on } S_1 \text{ is given by } \vec{F}(\vec{r}(u, \theta)) \\ = \langle u \sin(\theta), u \cos(\theta), 0 \rangle$$

$$\therefore \text{ on } S_1, \vec{F}(\vec{r}(u, \theta)) \cdot (\vec{r}_u \times \vec{r}_\theta) = 0$$

And: \vec{F} on S_2 is given by:

$$\vec{F}(\vec{z}(u, \theta)) = \langle u \sin(\theta), u \cos(\theta), 1 - u^2 \rangle$$

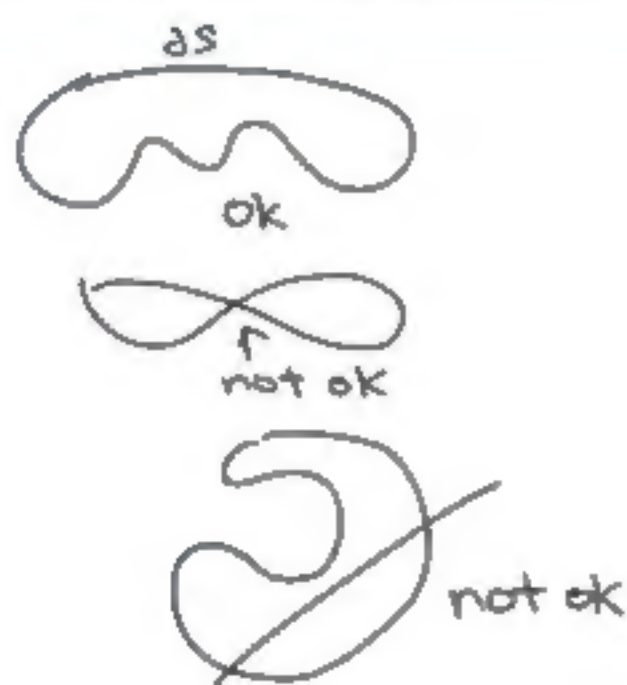

$$\therefore \vec{F}(\vec{z}(u, \theta)) \cdot (\vec{z}_u \times \vec{z}_\theta) = u(2u^2 \sin(\theta) \cos(\theta) \\ + 2u^2 \sin(\theta) \cos(\theta) + 1 - u^2)$$

$$\begin{aligned} \iint_S \vec{F} \cdot d\vec{z} &= \iint_{D_1} \vec{F} \cdot (\vec{r}_u \times \vec{r}_\theta) dA + \iint_{D_2} \vec{F} \cdot (\vec{z}_u \times \vec{z}_\theta) dA \\ &= \iint_{D_1} 0 dA + \iint_{D_2} u(4u^2 \sin(\theta) \cos(\theta) + 1 - u^2) dA \\ &= \frac{\pi}{2} \end{aligned}$$

IDEA: Generalize Green's theorem to surfaces which are not flat...

Prop (Stokes's theorem):

suppose S is a piecewise smooth surface with piecewise-smooth boundary curve, which is closed and has only one component. If a vector field with continuous partial derivatives on S , then $\iint_S \text{curl}(\vec{F}) \cdot d\vec{S} = \int_{\partial S} \vec{F} \cdot d\vec{r}$

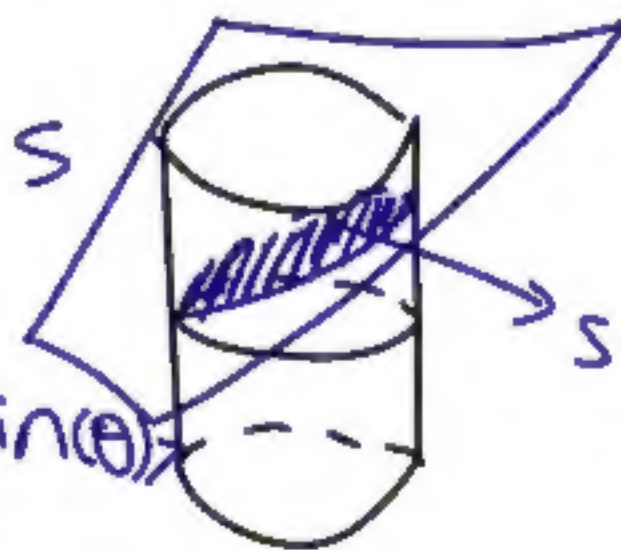

Ex: Compute $\int_C \vec{F} \cdot d\vec{r}$ for $\vec{F} = \langle -y^2, x, z^2 \rangle$ and C the curve of intersections of plane $y+z=2$ and cylinder $x^2+y^2=1$

Sol: We need $C = \partial S$ for some surface S

A good choice:

$$\vec{r}(r, \theta) = \langle r \cos(\theta), r \sin(\theta), 2 - r \sin(\theta) \rangle$$

$$\text{on } (r, \theta) \in [0, 1] \times [0, 2\pi]$$

By Stokes's theorem:

$$\int_C \vec{F} \cdot d\vec{r} = \int_{\partial S} \vec{F} \cdot d\vec{r} = \iint_S \text{curl}(\vec{F}) \cdot d\vec{S}$$

$$= \iint_D \text{curl}(\vec{F})(\vec{r}(r, \theta)) \cdot (\vec{r}_u \times \vec{r}_v) dA$$

$$\text{curl}(\vec{F}) = \nabla \times \vec{F} = \det \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \partial/\partial x & \partial/\partial y & \partial/\partial z \\ -y^2 & x & z^2 \end{vmatrix} = \langle 0, 0, 1+2y \rangle$$

$$\text{curl}(\vec{F})(S(r, \theta)) = \langle 0, 0, 1+2r\sin(\theta) \rangle$$

$$\vec{S}_r = \langle \cos(\theta), \sin(\theta), -\sin(\theta) \rangle$$

$$\vec{S}_\theta = \langle -r\sin(\theta), r\cos(\theta), -r\cos(\theta) \rangle$$

$$\therefore \vec{S}_r \times \vec{S}_\theta = \det \begin{bmatrix} \vec{i} & \vec{j} & \vec{k} \\ \cos(\theta) & \sin(\theta) & -\sin(\theta) \\ -r\sin(\theta) & r\cos(\theta) & -r\cos(\theta) \end{bmatrix}$$

$$= r \langle 0, 1, 1 \rangle \quad \text{has correct orientation for counterclockwise from above.}$$

$$\begin{aligned} \therefore \int_C \vec{F} \cdot d\vec{r} &= \iint_D \langle 0, 0, 1+2r\sin(\theta) \rangle \cdot r \langle 0, 1, 1 \rangle dA \\ &= \int_{r=0}^1 \int_{\theta=0}^{2\pi} r(1+2r\sin(\theta)) d\theta dr \\ &= \pi \end{aligned}$$

Exercise: Directly compute the line integrals...
